Assessment Report

Report addressed exclusively to the healthcare professional prescribing the test to the patient. The indicated assessments have been made based on the results obtained and the data provided to the laboratory and should be assessed together with the patient's history. It is a guide to help interpret the results, it does not constitute a treatment by itself. The treatments must be implemented and supervised by health professionals.

Genetics

NOTE: Genetic studies should be interpreted in the clinical context. The prevalence and significance of some allelic variants may be specific to the population of origin. Any positive result in genetic testing indicates a predisposition, but there may be additional risks not measured by the test. Conversely, negative results do not imply the total absence of risk.

Recommendations

Assess the phenotype

CELIAC DISEASE:
- The levels of IgA/IgG antibodies against transglutaminase, gliadin and endomysium in blood.
- The levels of anti-gliadin IgA antibodies in stool.

HASHIMOTO'S THYROIDITIS:
- The levels of antibodies against thyroglobulin and thyrosomal peroxidase.
- Thyroid function.
