Genetics

NOTE: Genetic studies should be interpreted in the clinical context. The prevalence and significance of some allelic variants may be specific to the population of origin. Any positive result in genetic testing indicates a predisposition, but there may be additional risks not measured by the test. Conversely, negative results do not imply the total absence of risk.

GLUTEN intolerance (Celiac disease)
High risk

Celiac disease is a multi-organ inflammatory disorder that damages the intestine when exposed to gluten-containing foods. It affects 1% of the population, although the vast majority of patients are undiagnosed. HAPLOTYPE DQ2 POSITIVE: >90% of celiacs HAPLOTYPE DQ8 POSITIVE: 5-10% of celiacs [Brown, N.K., et al. (2019). https://doi.org/10.14309/ajg.0000000000000310]
